

Activity 1.2

1. Define ethics as a science and an art. Give its importance to every person and organization.
 - **Ethics as a Science**
 - Ethics can be seen as a science because it's not just random opinion, it's an organized way of studying human actions and figuring out if they're good or bad, right or wrong. It follows logic and reasoning to come up with general rules that people can use, but it is different from something like physics or chemistry because it does not just observe what people do, it actually tells people what they should do.
 - **Ethics as an Art**
 - Ethics can also be an art, just because you know the rules of right and wrong doesn't automatically make someone good at applying them in real life. Real situations are unpredictable and involve a lot of variables and are not like what to be expected or basically expectation vs. reality, so everyone needs practice and good judgment to actually live out these principles well. In a way, that's basically a skill, the same way painting or any craft is a skill you get better at through practice and the more you practice the more you appreciate it like a finished painting you work hard for.
 - **Why Ethics Matters to a Person**
 - For an individual, ethics helps guide everyday choices and tells you what's right or wrong in different situations. It helps us build a good character over time and makes relationships with our family and friends stronger because trust and honesty come from having good values. Without ethics, people would just act on impulse or say intrusive thoughts without really thinking about the people around them.
 - **Why Ethics Matters to an Organization**
 - For companies or organizations, ethics is just as important. It builds trust between the company, its employees, and the public. It helps make sure the policies are fair, like how workers are treated or how decisions are made. Without ethics, organizations can become corrupt or take advantage of people, so having good values keeps things in check and helps the company actually help the community instead of just harming it.

2. Discuss the nature of man in terms of the dual theory. Include the unique characteristics of humans in line with their rational powers.

- **The Body**

- The dual theory says a person is made up of two parts working together, the body and the soul. The body is the physical part of us. It's made of matter, so it grows, gets old, and eventually dies like everything else in nature. It's also how we interact with the world around us, through our senses like sight, touch, and hearing. In terms of basic functions like eating, growing, and reproducing, our bodies work a lot like other living things.

- **The Soul**

- The soul is the part of us that isn't physical. It's what gives us life and it's the reason we can think and make decisions. Unlike the body, the soul doesn't decay or break down. It's basically what makes our body alive instead of just being a bunch of cells and organs doing nothing.

- **How Body and Soul Work Together**

- The body and soul are not two separate things just stuck together, they are one whole person. You can't really separate the two and still call it a full human being. The soul gives the body life and identity, and the body gives the soul a way to exist and interact with the world.

- **What Makes Humans Different**

- What makes humans stand out from plants and animals is our ability to think and choose freely. Our intellect lets us understand things on a deeper level, not just react to what's around us like animals do. Our free will lets us make choices based on what we think is right, not just instinct, which is also why we can be held responsible for our actions. Because of this, humans can build real relationships, work toward personal goals, and think about deeper questions like the meaning of life, things plants and animals just can't do.
